

## Characterization of antibiotic-resistant *Escherichia coli* associated with urinary tract infections in Southern Colombia

**Figure S1.:** Verification of chromosomal DNA extraction. A 1 % agarose gel run in 1X TBE buffer at 80 V for 1 hour was treated with Ez Vision (AMRESCO) and photodocumented in the Smart Doc Imaging Enclosure Benchmark Accuris E300 UV at a wavelength of 302 nm. In the first and the last lanes, the molecular markers *Lambda HindIII*, and 1 kb (Promega) are observed; *E. coli* isolates 1 to 17 are loaded in lanes 2 to 18.
